An air conditioning system, using several components, includes a compressor to pressurize a chemical called freon, and drastically lower its temperature. The surrounding air then also cools, and in turn keeps you from melting. If the system fails to be properly pressurized, such as if there is a leak present, the air will not be able to be cooled.

One of the most common parts related to AC issues is the compressor. The compressor is responsible for processing the refrigerant in a way that cools the entire cabin by making the air blowing through the vents cold. If the compressor is broken or worn out, then it will result in hot air rather than cool air blowing through the vents.
