reducing regulators since they are more common. Later, we will provide some direction for selecting back-pressure regulators. A flow curve illustrates a regulator's performance in terms of outlet pressure (Y axis) and flowrate (X axis). Flow is not controlled by the regulator. It is controlled downstream by a valve or flowmeter.

With most single-stage regulator regulators, except those that use a pressure compensated design, a large drop in inlet pressure will

cause a slight increase in outlet pressure. This happens because the forces acting on the valve change, due to the large drop in pressure, from when the outlet pressure was initially set.

Pressure regulator or pressure relief valve?
Regulators most commonly are used for both the pressure-reducing valve and back pressure regulator (which would be a non-ASME relief valve). This is because the regulators can monitor the tank pressure directly and respond more quickly to changes in blanket gas pressure, preventing overpressure or underpressure from occurring on the tank.

wide variety of valve bodies in various styles, materials, connections and sizes. Selection is primarily dependent on the service conditions, the task, and the load characteristics of the application. The most common types are ball valves, butterfly valves, globe valves, and gate valves. Ball Valves:

Control Valve Basics: Sizing and Selection

A water pressure regulator is a dome-shaped brass fitting that generally is found just past the main shutoff valve, where the main water line enters the house. It usually has

an adjustment screw on top. Inside, a water pressure regulator has a variable spring-loaded diaphragm that automatically widens and narrows depending on the amount of water pressure entering the valve.

How a Water Pressure Regulator Works

Pressure Reducing Valves are designed to reduce incoming water or steam pressure to a safer constant predetermined downstream level. Depending on the type of valve, the downstream pressure is established by a pressure adjustment setting on the valve or by an external sensor.

Pressure Reducing Valves - Watts

A back pressure regulator is basically a precision pressure relief device which is used to control a maximum gas system pressure. A single model is available. A broad range of pneumatically actuated diaphragm valves are available with operating pressures up to 4,500 psig (310 bar) with a mix of normally closed (NC) and normally open (NO) configurations.
